SC1015 MINI PROJECT

Wine Quality Prediction using Machine Learning

By FR1-Team 2

Ayushmaan Kumar Yadav - N2400848H Yu Huajia - U2322589F Diego Claude - N2402496D

Problem Statement

Explores different ways to predict wine quality using physicochemical properties of red wine

The original dataset contains integer quality scores ranging from 3 to 8

Each team member framed a unique machine learning problem based on this dataset

Dataset

- Source: UCI Wine Quality Dataset
- File used: winequality-red.csv
 (https://www.kaggle.com/datasets/yasserh/wine-quality-dataset/data)
- Target: quality
- Features: 11 physicochemical test results per wine (e.g., alcohol, pH, sulphates)

Methodology

- 1. Data Cleaning & Preprocessing
- 2. Exploratory Data Analysis (EDA)
- 3. Modeling
- 4. Upsampling Techniques
- 5. Evaluation

Approach 1

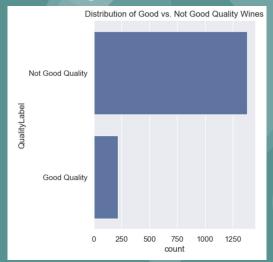

Explored red wine quality prediction as a binary classification problem, where each wine sample was categorized into **2** quality levels:

- Not good <7
- Good ≥7

Distribution of Quality

Not Good: 1382 samples (86%)

• Good: 217 (14%)

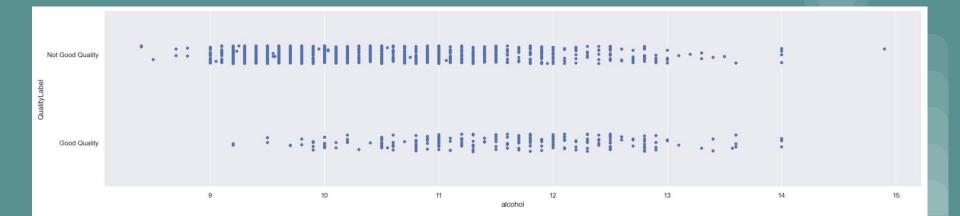

- Reframed wine quality as a **binary task**:
- Practical for consumer-facing or industrial quality filtering
- Simplifies modeling but introduces heavy class imbalance
- Targets real-world use: "Is this wine worth recommending?"

Feature Correlation & Insights

What Influences Quality?

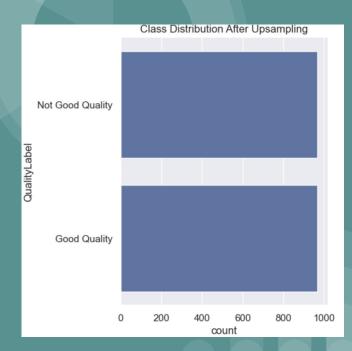

- Alcohol has strong positive correlation with "Good" wines
- Volatile acidity negatively affects perceived quality
- EDA showed higher alcohol content often means higher score
- Feature selection informed by heatmaps and histograms

| | | | | (| Correlation | on Matrix | of Wine | Datase | t | | | | | 1.0 | |

| | fixed acidity | volatile acidity | citric acid | residual sugar | chlorides | free sulfur dioxide | total sulfur dioxide | density | Hd | sulphates | alcohol | quality | | | |

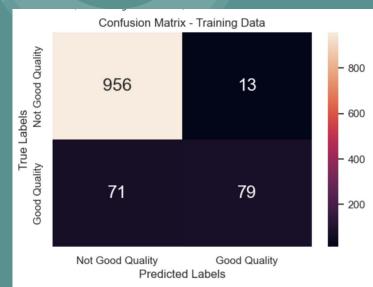

Train/Test Split & Scaling

- Used 80/20 stratified split to preserve class ratio
- Applied **StandardScaler** to normalize features
- Preprocessing done before both models (with and without upsampling)
- Ensures fair feature weighting and robust comparison

First Model: Random Forest Imbalanced

- Trained on original (imbalanced) dataset
- High accuracy (~88%), but very low recall for "Good" class
- Model overfits to majority "Not Good" wines.
- Highlights why accuracy is misleading for imbalanced data

Balancing classes with random oversampling

Randomly duplicated "Good" wine samples to match "Not Good"

Prevented bias during model training

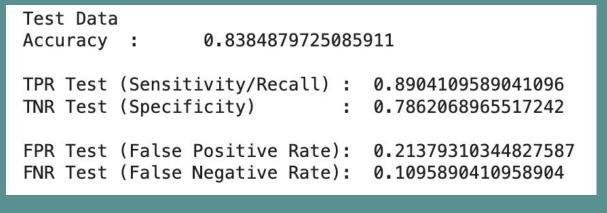

Easy but effective way to balance binary classes

• Performed **only on the training set** to avoid data leakage

```
Original class distribution:
quality
      10
     681
     638
     199
      18
Name: count, dtype: int64
Balanced class distribution:
quality
     681
     681
     681
     681
     681
     681
Name: count, dtvpe: int64
```

Final Model - Balanced vs Unbalanced

- Retrained same model on balanced data
- Improved recall and F1 for "Good" class
- Accuracy stable, but model is fairer and more generalizable
- Demonstrates how simple resampling improves real-world performance

Approach 2

Explored red wine quality prediction as a multi-class classification problem, where each wine sample was categorized into **3** quality levels:

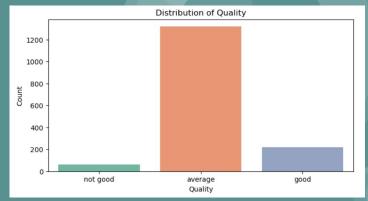

- Not good (≤4)
- Average (5 6)
- Good (≥7)

Distribution of Quality

Not Good: 63 samples (4%)

Average: 1,319 (82%)

Good: 217 (14%)

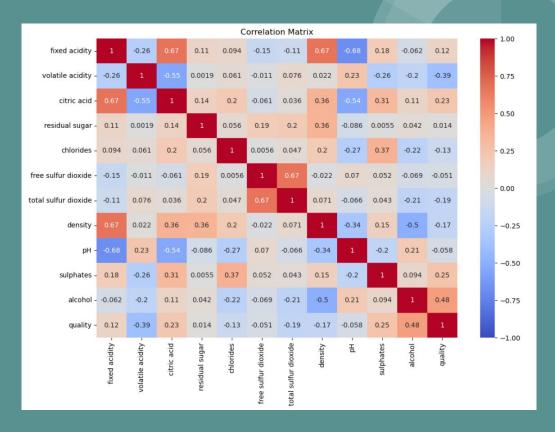

- A wine rated 5 (average) differs significantly from one rated 3 (not good) or 8 (good)
- The minority classes ('Bad' and 'Good') constitute just 18% of observations

Heavy skews towards "Average" wines → severe Class-Imbalance

Feature Distribution

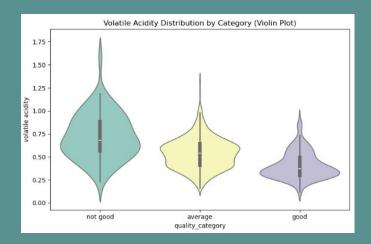

Correlation Matrix

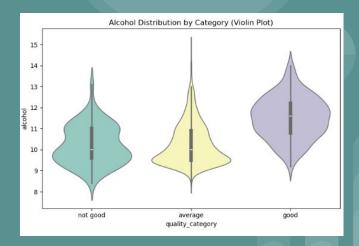

Feature Distribution

↓ Volatile acidity indicates better flavor

↑ **Alcohol** correlates with higher quality

Train & Test Split

Split data 80/20 (stratified to preserve class ratios)

- 80% train
- 20% test

Standardized features (StandardScaler)

- mean = 0
- Standard Deviation = 1

Baseline Models (No Upsampling)

Models trained on imbalanced data:

- Random Forest: accuracy of 87.50%, macro f1 of 0.54
- XGBoost: accuracy of **86.56%**, macro f1 of **0.58**

| === Random For Accuracy: 0.87 | | ampling) : | | |
|----------------------------------|-----------|------------|----------|---------|
| necaracy. | precision | recal1 | fl-score | support |
| average | 0.90 | 0.95 | 0.93 | 264 |
| good | 0.69 | 0.67 | 0.68 | 43 |
| not good | 0.00 | 0.00 | 0.00 | 13 |
| accuracy | | | 0.88 | 320 |
| macro avg | 0.53 | 0.54 | 0.54 | 320 |
| weighted avg | 0.84 | 0.88 | 0.86 | 320 |

| === XGBoost (Accuracy: 0.8 | | g) === | | |
|--------------------------------|-----------|--------|----------|---------|
| | precision | recal1 | fl-score | support |
| average | 0.91 | 0.93 | 0.92 | 264 |
| good | 0.69 | 0.72 | 0.70 | 43 |
| not good | 0.17 | 0.08 | 0.11 | 13 |
| accuracy | | | 0.87 | 320 |
| macro avg | 0.59 | 0.58 | 0.58 | 320 |
| weighted avg | 0.85 | 0.87 | 0.86 | 320 |

Addressing Class Imbalance (SMOTE)

SMOTE mechanics:

- Finds k-nearest neighbors for each minority sample
- Interpolates new synthetic points along the feature vectors

Effect on data:

- 'Not Good' increases from 13 → ~264 samples.
- 'Good' increases from 43 → ~264 samples

Baseline Models (Upsampled)

Models trained on upsampled data:

- Random Forest: accuracy of 83.75%, HIGHER macro f1 of 0.65
- XGBoost: accuracy of 84.69%, HIGHER macro f1 of 0.61

| === Random Forest (Upsampled) === Accuracy: 0.8375 | | | | | | | | | | |
|--|-----------|--------|----------|---------|--|--|--|--|--|--|
| Classificatio | n Report: | | | | | | | | | |

Final Model Comparison

| Model | Accuracy | Macro F1 | Weighted F1 |
|----------------------------|----------|----------|-------------|
| Random Forest (Imbalanced) | 87.50% | 0.54 | 0.86 |
| XGBoost (Imbalanced) | 86.56% | 0.58 | 0.86 |
| Random Forest + SMOTE | 83.75% | 0.65 | 0.85 |
| XGBoost + SMOTE | 84.69% | 0.61 | 0.85 |

Approach 3

Multi-Class Wine Quality Classification (Scores 3 to 8)

- Predicted exact wine quality scores (3 to 8) using multi-class classification
- More fine-grained than binary or 3-class setups
- Better reflects how wines are rated in real life

1. Started with Linear Regression

Poor R^2 and high RMSE \rightarrow unsuitable for discrete, ordinal scores

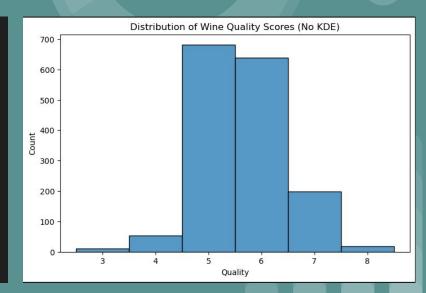

Linear Regression Model Evaluation:

MAE: 0.503530441552438 RMSE: 0.6245199307980125 R^2: 0.4031803412796229

2. Built XGBoost Classifier

Biased toward majority classes (5 & 6)

| | | precision | recall | f1-score | support |
|----------|------|------------|--------|----------|----------|
| | | pi ccision | | .2 300.0 | эарро, с |
| | 3 | 0.00 | 0.00 | 0.00 | 2 |
| | 4 | 0.50 | 0.09 | 0.15 | 11 |
| | 5 | 0.72 | 0.72 | 0.72 | 136 |
| | 6 | 0.62 | 0.69 | 0.65 | 128 |
| | 7 | 0.71 | 0.60 | 0.65 | 40 |
| | 8 | 0.33 | 0.33 | 0.33 | 3 |
| accui | racy | | | 0.66 | 320 |
| macro | avg | 0.48 | 0.41 | 0.42 | 320 |
| weighted | avg | 0.66 | 0.66 | 0.65 | 320 |

3. Applied Random Oversampling

Better F1 for rare classes, but risk of overfitting

Additional Insights

Feature Importance for the final model

Conclusion

- Problem 1 Binary Classification ("Good" vs. "Not Good")
- ✓ Problem 2 Multi-class Classification ("Not Good", "Average", and "Good")
- ✓ Problem 3 Multi-class Classification (Quality 3–8)
